on Jun. 9, 1999; the entire content of which is hereby incorporated by reference. The present invention relates to a tank for storing a foaming and/or foaming and frothing product, in particular for the storage of a beverage having a foaming and/or frothing agent, as well as to a tank system for storing and dispensing such a foaming and/or frothing product. In the prior art, tank systems of the type mentioned above are used to store beverages and/or foodstuffs, which are marketed in a foaming and/or frothing state, i.e. in a foamable form. Such tank systems comprise a container, in which foaming and/or frothing product is stored under the force of gravity, and in which the foaming and/or frothing product can be dispensed from the container. The foaming

---

and/or frothing product stored in the container in the foaming and/or frothing state is generally stored in a solid state in the tank system. However, it is also possible to store the foaming and/or frothing product in a liquid state in the tank system. In this respect, the dispensing of the foaming and/or frothing product from the container can be carried out in various ways, i.e. for example by means of a dispensing valve or via a pour-out method. A problem with the known tank systems is the need to provide a suitable container, which can be expensive and in which foaming and/or frothing product can be stored in a stable condition for a long period of time. Accordingly, one object of the present invention is to provide a tank for storing a foaming and/or frothing
