by Kanazawa University In order to protect a  
person's skin, the person wears a face mask to  
block the entry of contaminants to the person's  
skin. The face mask prevents the contaminants  
from entering into the person's mouth and eyes.

---

U.S. Pat. No. 5,334,301 to Rose, et al. discloses an ophthalmic care mask with a first portion including a flexible, pliable frame formed of a urethane or nitrile rubber that defines a seal on the wearer's face, an eye shield and a second portion that is a soft, pliable, flexible, hydrophilic foam material. The first and second portions are removably secured together by a pair of rigid, impervious plastic fasteners. The face mask is stated to be used to minimize the deposition of contaminant particles from the atmosphere into the patient's eyes. U.S. Pat. No. 5,718,087 to Moll, et al. discloses a disposable face mask with an interior surface and an exterior surface. The mask includes a fluid tight seal to create an airtight barrier to prevent any liquid or gaseous

---

substances from leaking around the seal. U.S. Pat. No. 5,471,802 to Howard discloses an eye and face mask that includes a pair of interlocking layers including a first outer layer and a second inner layer having an inner periphery and an outer periphery. The mask includes a channel formed in the inner periphery of the second layer such that when the first layer is placed over the second layer, the channels can be aligned to permit communication between the mask and the wearer's skin. The mask is stated to be designed to deliver oxygen or other gases to the wearer's skin for treatment of an injury or disease. U.S. Pat. No. 5,186,201 to Cochran discloses an absorbent facial mask.
