The concentrations of major and trace elements in plastic wastes were determined by a microwave induced plasma-atomic emission spectrometer. The determination of major elements in plastic wastes is relevant because of their potential health hazards. The plastic samples were chopped into small pieces and dried at 60 degrees C for one day, and then hand-mixed with 6.0 mL of nitric acid for 4h in an ultrasonic bath. After filtration, the sample solutions were analyzed by the MIP-AES technique. The concentrations of Cr, As, Pb, Cd, and Mn in plastic wastes from four cities in Iran, which were collected from Duzce, Artvin, Ardabil, and Kayseri were measured. The samples contained Al, B, Ba, Bi, Ca, Ce, Cs, Eu, Fe, Hf, La, Lu, Nd, Pb, Rb, Sr, Tl, U, V, Y, Zn, and Zr at concentrations of less than or equal to 0.04, 0.08, 0.30, 0.19, 0.12, 0.09, 0.07, 0.04, 0.05, 0.08, 0.25, 0.15, 0.10, 0.05, 0.06, 0.20, 0.10, 0.07, 0.07, 0.07, 0.11, 0.06, 0.17, 0.10, 0.07, 0.06, and 0.19 mg/kg, respectively. All of these values are lower than the relevant national and international limits. The results of this study will help to determine the hazards of plastic waste.// +build!ignore_autogenerated /* Copyright The Kubernetes Authors.
