Field of the Invention The present invention relates to a system and method for ultrasound imaging, and more particularly to a system and method for generating ultrasound images based on position information of an object to be examined. 2. Related Art Ultrasound imaging is widely used in the field of medical diagnosis. Such ultrasound imaging is performed by a system generating ultrasound pulses and a system receiving the ultrasound pulses. The system generating the ultrasound pulses emits ultrasound in the form of ultrasound pulses towards the object, for example, the human body, and the system receiving the ultrasound pulses detects the ultrasonic echoes reflected from the object. The system generates image data, for example, the B mode image data, by analyzing the detected ultrasonic echoes. A position information amount of the object is obtained by measuring a time required for the ultrasonic pulses to travel from a transmitting position to the object. The system generates the B mode image data by analyzing the position information amount. The B mode image data has waveforms corresponding to specific depth. Therefore, a specific depth has a meaning. For example, a depth having a waveform rising from left to right is referred to as an xe2x80x9cA mode image dataxe2x80x9d, and a depth having a waveform falling from left to right is referred to as a xe2x80
